CABELEC® CC6135 CONDUCTIVE COMPOUND

Product highlights
CABELEC CC6135 conductive concentrate is an electrically conductive concentrate made from conductive carbon black dispersed in a modified styrenic resin. Its electrical and mechanical properties are not dependent on atmospheric conditions. However, these properties can vary depending on the type and level of dilution resin used and the processing conditions.

Unlike standard conductive compounds, which have very limited dilution potential, CABELEC CC6135 conductive concentrate can be diluted with a high quantity of natural resin (see graph below). This allows users of CABELEC CC6135 conductive concentrate to benefit from the versatility of this concentrate and from enhanced physical properties due to higher levels of dilution resin.

Key applications
CABELEC CC6135 conductive concentrate (after dilution) can reduce the hazards of electrostatic discharge in applications such as packaging and handling of electronic components, explosive powders and pigments.

Processing

Pre-drying
CABELEC CC6135 conductive concentrate absorbs moisture under normal storage conditions and this can result in surface blemishes. It is therefore advisable to dry the concentrate prior to use. Usually 2-4 hrs in a hopper drier at 80°C is sufficient time to reduce the moisture content to an acceptable level. Dilute CABELEC CC6135 conductive concentrate uniformly by tumble or high-speed blending with extrusion-grade high impact polystyrene before use. The blending ratio may vary, depending on the customer’s requirements (a 50/50 blend is generally suitable). Pre-drying of the diluent high impact polystyrene may also be needed, in the event that it is wet or has been stored under high relative humidity conditions.

Extrusion
Diluted CABELEC CC6135 conductive concentrate can be processed on conventional extrusion equipment. The blend should be processed under low shear conditions. To promote good electrical and mechanical properties of the material it is suggested that high shear mixing elements be avoided. As a general guide, extrusion temperatures of 170-210°C have been used successfully on extrusion lines. Temperatures in excess of 230°C should be avoided. Actual extrusion temperatures should be adapted according to the nature of the equipment and the manufactured article to give optimum extrusion quality.

The information given in this section should be used for guidance only as different equipment could require different operating conditions to achieve the desired results.
The data in the table above are typical test values intended as guidance only and are not product specifications. Product specifications are available upon request from your Cabot representative.

When diluted with a commercially available extrusion grade high impact polystyrene (HIPS):

Surface resistivity measured on 400μm thick extruded tape at various dilution rates for CABELEC CC6135 conductive concentrate (according to internal Cabot Test Method CTM E042):

Product form and logistics
- Product form: pellets
- Regional availability: global
- Packaging options: 25 kg bags

For information on product-specific storage conditions, please refer to the applicable Safety Data Sheet (SDS) available from your Cabot representative or at cabotcorp.com.
